

Euro Air provides a DFC System to help the famous CliniClowns in Holland to entertain sick children

BLT Luchttechniek from Breda, Holland has helped create a healthy environment in a protected building at the NS complex in one of the old monumental buildings on the old railway premises in Amersfoort.

In this old renovated building the CliniClowns have their headquarters. The headquarter is also used as a training facility for the CliniClowns, but mainly an office facility with the demands for high comfort.

The CliniClowns are working to entertain sick children that can follow the clowns via live streaming on the internet from anywhere in Holland. The CliniClowns are all very happy about their new working environment which they find very fulfilling.

BLT chose the Euro Air DFC Induction system for these long straight ducts, in order to optimize the indoor environment.

The DFC system is ideal to use in a building with long straight textile based ventilation runs like in the old Car Railway Workshop in Amersfoort.

The patented baffle system that ensures a perpendicular flow when the air is exiting the textile ensures a uniform air distribution in the entire length of the duct.

The Euro Air DFC system helps create a good and draft-free environment for the occupants of the room.

The Euro Air DFC System is suitable for both cooling, heating and ventilation. Furthermore, BLT has chosen the hybrid system which means that both the DFC and the fabric will be active in distributing the fresh air into the room.

Euro Air supplies tailored solutions and customized colours, shapes and sizes to meet the architectural design requirements.
